

[1] Tool: ChatGPT

Prompt: Please write a Python code to convert my “Date time” with mixed ISO formats to a date time object as right now converting to a date time object using pd does not work for every value.

Output:

Ahh I see the issue — your DateTime column has mixed ISO formats:

Some rows have a timezone offset:

2014-06-10T00:00:00-05:00

Others don't:

2013-10-01T09:31:00

The fix: let pandas infer the format and handle both with format="mixed" and errors="coerce":

```
animals["DateTime"] = pd.to_datetime(
    animals["DateTime"],
    format="mixed",
    errors="coerce",
    utc=True # normalize everything to UTC first
).dt.tz_convert(None)
```

That will parse both formats safely:

[2] Tool: ChatGPT

Prompt: Please write Python code to extract only the first part of the color column. Examples are Yellow/Black and Red/White

Output:

You want to extract only the first color (the part before the /) from entries like "Yellow/Black", "Brown Tabby", or "Red/White".

Here's how you can do that in pandas:

Assuming your color column is named 'Color'

```
df['PrimaryColor'] = df['Color'].str.split('/').str[0]
```

If you also want to clean up extra spaces (for entries like "White / Brown"), you can add .str.strip()
